2.1.5 - Configure addons and PSPs	10
3.1 - Rancher Management Control Plane Installation	13
3.1.1 - Disable the local cluster option	13
3.1.2 - Enable Rancher Audit logging	13
3.2 - Rancher Management Control Plane Authentication	14
3.2.1 - Change the local admin password from the default value	14
3.2.2 - Configure an Identity Provider for Authentication	14
3.3 - Rancher Management Control Plane RBAC	15
3.3.1 - Ensure that administrator privileges are only granted to those who require them	15
3.4 - Rancher Management Control Plane Configuration	15
3.4.1 - Ensure only approved node drivers are active	15
Appendix A - Complete RKE cluster.yml Example	16
Appendix B - Complete RKE Template Example	19

Hardening Guide for Rancher 2.3.x with Kubernetes 1.15

Overview

This document provides prescriptive guidance for hardening a production installation of Rancher v2.3.x with Kubernetes v1.15. It outlines the configurations and controls required to address Kubernetes benchmark controls from the Center for Information Security (CIS).

For more detail about evaluating a hardened cluster against the official CIS benchmark, refer to the [CIS Benchmark Rancher Self-Assessment Guide - Rancher v2.3.x](#).

Profile Definitions

The following profile definitions agree with the CIS benchmarks for Kubernetes.

A profile is a set of configurations that provide a certain amount of hardening. Generally, the more hardened an environment is, the more it affects performance.

Level 1

Items in this profile intend to:

- offer practical advice appropriate for the environment;
- deliver an obvious security benefit; and
- not alter the functionality or utility of the environment beyond an acceptable margin

Level 2

Items in this profile extend the “Level 1” profile and exhibit one or more of the following characteristics:

- are intended for use in environments or use cases where security is paramount

- act as a defense in depth measure
 - may negatively impact the utility or performance of the technology
-

1.1 - Rancher HA Kubernetes cluster host configuration

1.1.1 - Configure default sysctl settings on all hosts

Profile Applicability

- Level 1

Description

Configure sysctl settings to match what the kubelet would set if allowed.

Rationale

We recommend that users launch the kubelet with the `--protect-kernel-defaults` option. The settings that the kubelet initially attempts to change can be set manually.

This supports the following control:

- 2.1.7 - Ensure that the `--protect-kernel-defaults` argument is set to true (Scored)

Audit

- Verify `vm.overcommit_memory = 1`

```
sysctl vm.overcommit_memory
```

- Verify `kernel.panic = 10`

```
sysctl kernel.panic
```

- Verify `kernel.panic_on_oops = 1`

```
sysctl kernel.panic_on_oops
```

Remediation

- Set the following parameters in `/etc/sysctl.conf` on all nodes:

```
vm.overcommit_memory=1
kernel.panic=10
kernel.panic_on_oops=1
```

- Run `sysctl -p` to enable the settings.

1.1.2 - Install the encryption provider configuration on all control plane nodes

Profile Applicability

- Level 1

Description

Create a Kubernetes encryption configuration file on each of the RKE nodes that will be provisioned with the `controlplane` role:

NOTE: The `--experimental-encryption-provider-config` flag in Kubernetes 1.13+ is actually `--encryption-provider-config`

Rationale

This configuration file will ensure that the Rancher RKE cluster encrypts secrets at rest, which Kubernetes does not do by default.

This supports the following controls:

- 1.1.34 - Ensure that the `--experimental-encryption-provider-config` argument is set as appropriate (Scored)
- 1.1.35 - Ensure that the encryption provider is set to `aescbc` (Scored)

Audit

On the control plane hosts for the Rancher HA cluster run:

```
stat /opt/kubernetes/encryption.yaml
```

Ensure that:

- The file is present
- The file mode is 0600
- The file owner is root:root
- The file contains:

```
apiVersion: apiserver.config.k8s.io/v1
kind: EncryptionConfiguration
resources:
- resources:
- secrets
providers:
- aescbc:
  keys:
  - name: key1
    secret: <32-byte base64 encoded string>
- identity: {}
```

Where aescbc is the key type, and secret is populated with a 32-byte base64 encoded string.

Remediation

- Generate a key and an empty configuration file:

```
head -c 32 /dev/urandom | base64 -i -
touch /opt/kubernetes/encryption.yaml
```

- Set the file ownership to root:root and the permissions to 0600

```
chown root:root /opt/kubernetes/encryption.yaml
chmod 0600 /opt/kubernetes/encryption.yaml
```

- Set the contents to:

```
apiVersion: v1
kind: EncryptionConfig
resources:
- resources:
- secrets
providers:
- aescbc:
  keys:
  - name: key1
    secret: <32-byte base64 encoded string>
- identity: {}
```

Where secret is the 32-byte base64-encoded string generated in the first step.

NOTE:

Files that are placed in /opt/kubernetes need to be mounted in using the extra_binds functionality in RKE.

1.1.3 - Install the audit log configuration on all control plane nodes.

Profile Applicability

- Level 1

Description

Place the configuration file for Kubernetes audit logging on each of the control plane nodes in the cluster.

Rationale

The Kubernetes API has audit logging capability that is the best way to track actions in the cluster.

This supports the following controls:

- 1.1.15 - Ensure that the `--audit-log-path` argument is set as appropriate (Scored)
- 1.1.16 - Ensure that the `--audit-log-maxage` argument is as appropriate (Scored)
- 1.1.17 - Ensure that the `--audit-log-maxbackup` argument is set as appropriate (Scored)
- 1.1.18 - Ensure that the `--audit-log-maxsize` argument is set as appropriate (Scored)
- 1.1.37 - Ensure that the `AdvancedAuditing` argument is not set to false (Scored)

Audit

On each control plane node, run:

```
stat /opt/kubernetes/audit.yaml
```

Ensure that:

- The file is present
- The file mode is `0600`
- The file owner is `root:root`
- The file contains:

```
apiVersion: audit.k8s.io/v1beta1
kind: Policy
rules:
- level: Metadata
```

Remediation

On nodes with the `controlplane` role:

- Generate an empty configuration file:

```
touch /opt/kubernetes/audit.yaml
```

- Set the file ownership to `root:root` and the permissions to `0600`

```
chown root:root /opt/kubernetes/audit.yaml
chmod 0600 /opt/kubernetes/audit.yaml
```

- Set the contents to:

```
apiVersion: audit.k8s.io/v1beta1
kind: Policy
rules:
- level: Metadata
```

NOTE:

Files that are placed in `/opt/kubernetes` need to be mounted in using the `extra_binds` functionality in RKE.

1.1.4 - Place Kubernetes event limit configuration on each control plane host

Profile Applicability

- Level 1

Description

Place the configuration file for Kubernetes event limit configuration on each of the control plane nodes in the cluster.

Rationale

Set up the `EventRateLimit` admission control plugin to prevent clients from overwhelming the API server. The settings below are intended as an initial value and may need to be adjusted for larger clusters.

This supports the following control:

- 1.1.36 - Ensure that the admission control plugin `EventRateLimit` is set (Scored)

Audit

On nodes with the `controlplane` role run:

```
stat /opt/kubernetes/admission.yaml
stat /opt/kubernetes/event.yaml
```

For each file, ensure that:

- The file is present
- The file mode is 0600
- The file owner is root:root

For admission.yaml ensure that the file contains:

```
apiVersion: apiserver.k8s.io/v1alpha1
kind: AdmissionConfiguration
plugins:
- name: EventRateLimit
  path: /opt/kubernetes/event.yaml
```

For event.yaml ensure that the file contains:

```
apiVersion: eventratelimit.admission.k8s.io/v1alpha1
kind: Configuration
limits:
- type: Server
  qps: 5000
  burst: 20000
```

Remediation

On nodes with the controlplane role:

- Generate an empty configuration file:

```
touch /opt/kubernetes/admission.yaml
touch /opt/kubernetes/event.yaml
```

- Set the file ownership to root:root and the permissions to 0600

```
chown root:root /opt/kubernetes/admission.yaml
chown root:root /opt/kubernetes/event.yaml
chmod 0600 /opt/kubernetes/admission.yaml
chmod 0600 /opt/kubernetes/event.yaml
```

- For admission.yaml set the contents to:

```
apiVersion: apiserver.k8s.io/v1alpha1
kind: AdmissionConfiguration
plugins:
- name: EventRateLimit
  path: /opt/kubernetes/event.yaml
```

- For event.yaml set the contents to:

```
apiVersion: eventratelimit.admission.k8s.io/v1alpha1
kind: Configuration
limits:
- type: Server
  qps: 5000
  burst: 20000
```

NOTE:

Files that are placed in /opt/kubernetes need to be mounted in using the extra_binds functionality in RKE.

1.4.11 Ensure that the etcd data directory permissions are set to 700 or more restrictive

Profile Applicability

- Level 1

Description

Ensure that the etcd data directory has permissions of 700 or more restrictive.

Rationale

etcd is a highly-available key-value store used by Kubernetes deployments for persistent storage of all of its REST API objects. This data directory should be protected from any unauthorized reads or writes. It should not be readable or writable by any group members or the world.

Audit

On the etcd server node, get the etcd data directory, passed as an argument `--data-dir`, from the below command:

```
ps -ef | grep etcd
```

Run the below command (based on the etcd data directory found above). For example,

```
stat -c %a /var/lib/rancher/etcd
```

Verify that the permissions are 700 or more restrictive.

Remediation

Follow the steps as documented in [1.4.12](#) remediation.

1.4.12 - Ensure that the etcd data directory ownership is set to etcd:etcd

Profile Applicability

- Level 1

Description

Ensure that the etcd data directory ownership is set to etcd:etcd.

Rationale

etcd is a highly-available key-value store used by Kubernetes deployments for persistent storage of all of its REST API objects. This data directory should be protected from any unauthorized reads or writes. It should be owned by etcd:etcd.

Audit

On a etcd server node, get the etcd data directory, passed as an argument `--data-dir`, from the below command:

```
ps -ef | grep etcd
```

Run the below command (based on the etcd data directory found above). For example,

```
stat -c %U:%G /var/lib/rancher/etcd
```

Verify that the ownership is set to etcd:etcd.

Remediation

- On the etcd server node(s) add the etcd user:

```
useradd etcd
```

Record the uid/gid:

```
id etcd
```

- Add the following to the RKE `cluster.yml` kubelet section under `services`:

```
services:
  etcd:
    uid: <etcd user uid recorded previously>
    gid: <etcd user gid recorded previously>
```

2.1 - Rancher HA Kubernetes Cluster Configuration via RKE

(See Appendix A. for full RKE `cluster.yml` example)

2.1.1 - Configure kubelet options

Profile Applicability

- Level 1

Description

Ensure Kubelet options are configured to match CIS controls.

Rationale

To pass the following controls in the CIS benchmark, ensure the appropriate flags are passed to the Kubelet.

- 2.1.1 - Ensure that the `--anonymous-auth` argument is set to false (Scored)
- 2.1.2 - Ensure that the `--authorization-mode` argument is not set to `AlwaysAllow` (Scored)
- 2.1.6 - Ensure that the `--streaming-connection-idle-timeout` argument is not set to 0 (Scored)
- 2.1.7 - Ensure that the `--protect-kernel-defaults` argument is set to true (Scored)
- 2.1.8 - Ensure that the `--make-iptables-util-chains` argument is set to true (Scored)
- 2.1.10 - Ensure that the `--event-qps` argument is set to 0 (Scored)
- 2.1.13 - Ensure that the `RotateKubeletServerCertificate` argument is set to true (Scored)
- 2.1.14 - Ensure that the Kubelet only makes use of Strong Cryptographic Ciphers (Not Scored)

Audit

Inspect the Kubelet containers on all hosts and verify that they are running with the following options:

- `--streaming-connection-idle-timeout=<duration greater than 0>`
- `--authorization-mode=Webhook`
- `--protect-kernel-defaults=false`
- `--make-iptables-util-chains=false`
- `--event-qps=0`
- `--anonymous-auth=false`
- `--feature-gates="RotateKubeletServerCertificate=true"`
- `--tls-cipher-suites="TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_ECDSA_`

Remediation

- Add the following to the RKE `cluster.yml` kubelet section under `services`:

```
services:
  kubelet:
    extra_args:
      authorization-mode: "Webhook"
      streaming-connection-idle-timeout: "<duration>"
      protect-kernel-defaults: "true"
      make-iptables-util-chains: "true"
      event-qps: "0"
      anonymous-auth: "false"
      feature-gates: "RotateKubeletServerCertificate=true"
      tls-cipher-suites: "TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_ECDSA_
```

Where `<duration>` is in a form like `1800s`.

- Reconfigure the cluster:

```
rke up --config cluster.yml
```

2.1.2 - Configure kube-api options

Profile Applicability

- Level 1

Description

Ensure the RKE configuration is set to deploy the `kube-api` service with the options required for controls.

NOTE:

Enabling the AlwaysPullImages admission control plugin can cause degraded performance due to overhead of always pulling images. Enabling the DenyEscalatingExec admission control plugin will prevent the 'Launch kubectl' functionality in the UI from working.

Rationale

To pass the following controls for the kube-api server ensure RKE configuration passes the appropriate options.

- 1.1.1 - Ensure that the --anonymous-auth argument is set to false (Scored)
- 1.1.8 - Ensure that the --profiling argument is set to false (Scored)
- 1.1.11 - Ensure that the admission control plugin AlwaysPullImages is set (Scored)
- 1.1.12 - Ensure that the admission control plugin DenyEscalatingExec is set (Scored)
- 1.1.14 - Ensure that the admission control plugin NamespaceLifecycle is set (Scored)
- 1.1.15 - Ensure that the --audit-log-path argument is set as appropriate (Scored)
- 1.1.16 - Ensure that the --audit-log-maxage argument is set as appropriate (Scored)
- 1.1.17 - Ensure that the --audit-log-maxbackup argument is set as appropriate (Scored)
- 1.1.18 - Ensure that the --audit-log-maxsize argument is set as appropriate (Scored)
- 1.1.23 - Ensure that the --service-account-lookup argument is set to true (Scored)
- 1.1.24 - Ensure that the admission control plugin PodSecurityPolicy is set (Scored)
- 1.1.30 - Ensure that the API Server only makes use of Strong Cryptographic Ciphers (Not Scored)
- 1.1.34 - Ensure that the --experimental-encryption-provider-config argument is set as appropriate (Scored)
- 1.1.35 - Ensure that the encryption provider is set to aescbc (Scored)
- 1.1.36 - Ensure that the admission control plugin EventRateLimit is set (Scored)
- 1.1.37 - Ensure that the AdvancedAuditing argument is not set to false (Scored)

Audit

- On nodes with the controlplane role inspect the kube-apiserver containers:

```
bash docker inspect kube-apiserver
```

- Look for the following options in the command section of the output:

```
--anonymous-auth=false
--profiling=false
--service-account-lookup=true
--enable-admission-plugins= "ServiceAccount, NamespaceLifecycle, LimitRanger, PersistentVolumeLabel, DefaultStorageClass, Res
--encryption-provider-config=/opt/kubernetes/encryption.yaml
--admission-control-config-file=/opt/kubernetes/admission.yaml
--audit-log-path=/var/log/kube-audit/audit-log.json
--audit-log-maxage=5
--audit-log-maxbackup=5
--audit-log-maxsize=100
--audit-log-format=json
--audit-policy-file=/opt/kubernetes/audit.yaml
--tls-cipher-suites: "TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256, TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256, TLS_ECDHE_ECDSA_WITH
```

- In the volume section of the output ensure the bind mount is present:

```
/var/log/kube-audit:/var/log/kube-audit
```

Remediation

- In the RKE cluster.yml add the following directives to the kube-api section under services:

```
services:
  kube-api:
    pod_security_policy: true
    extra_args:
      anonymous-auth: "false"
      profiling: "false"
      service-account-lookup: "true"
      enable-admission-plugins: "ServiceAccount, NamespaceLifecycle, LimitRanger, PersistentVolumeLabel, DefaultStorageClass
      encryption-provider-config: /opt/kubernetes/encryption.yaml
      admission-control-config-file: "/opt/kubernetes/admission.yaml"
      audit-log-path: "/var/log/kube-audit/audit-log.json"
      audit-log-maxage: "5"
      audit-log-maxbackup: "5"
      audit-log-maxsize: "100"
```

```
audit-log-format: "json"
audit-policy-file: /opt/kubernetes/audit.yaml
tls-cipher-suites: "TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256,TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384,TLS_ECDHE_ECDSA_WITH_CHACHA20_POLY1305,TLS_ECDHE_ECDSA_WITH_CHACHA20_POLY1305"
extra_binds:
- "/var/log/kube-audit:/var/log/kube-audit"
- "/opt/kubernetes:/opt/kubernetes"
```

- Reconfigure the cluster:

```
rke up --config cluster.yml
```

NOTE:

Files that are placed in /opt/kubernetes need to be mounted in using the extra_binds functionality in RKE.

2.1.3 - Configure scheduler options

Profile Applicability

- Level 1

Description

Set the appropriate options for the Kubernetes scheduling service.

NOTE: Setting --address to 127.0.0.1 will prevent Rancher cluster monitoring from scraping this endpoint.

Rationale

To address the following controls on the CIS benchmark, the command line options should be set on the Kubernetes scheduler.

- 1.2.1 - Ensure that the --profiling argument is set to false (Scored)
- 1.2.2 - Ensure that the --address argument is set to 127.0.0.1 (Scored)

Audit

- On nodes with the controlplane role: inspect the kube-scheduler containers:

```
docker inspect kube-scheduler
```

- Verify the following options are set in the command section.

```
--profiling=false
--address=127.0.0.1
```

Remediation

- In the RKE cluster.yml file ensure the following options are set:

```
services:
...
scheduler:
  extra_args:
  profiling: "false"
  address: "127.0.0.1"
```

- Reconfigure the cluster:

```
rke up --config cluster.yml
```

2.1.4 - Configure controller options

Profile Applicability

- Level 1

Description

Set the appropriate arguments on the Kubernetes controller manager.

NOTE: Setting --address to 127.0.0.1 will prevent Rancher cluster monitoring from scraping this endpoint.

Rationale

To address the following controls the options need to be passed to the Kubernetes controller manager.

- 1.3.1 - Ensure that the `--terminated-pod-gc-threshold` argument is set as appropriate (Scored)
- 1.3.2 - Ensure that the `--profiling` argument is set to false (Scored)
- 1.3.6 Ensure that the `RotateKubeletServerCertificate` argument is set to true (Scored)
- 1.3.7 - Ensure that the `--address` argument is set to 127.0.0.1 (Scored)

Audit

- On nodes with the `controlplane` role inspect the `kube-controller-manager` container:

```
docker inspect kube-controller-manager
```

- Verify the following options are set in the command section:

```
--terminated-pod-gc-threshold=1000
--profiling=false
--address=127.0.0.1
--feature-gates="RotateKubeletServerCertificate=true"
```

Remediation

- In the RKE cluster `.yaml` file ensure the following options are set:

```
services:
  kube-controller:
    extra_args:
      profiling: "false"
      address: "127.0.0.1"
      terminated-pod-gc-threshold: "1000"
      feature-gates: "RotateKubeletServerCertificate=true"
```

- Reconfigure the cluster:

```
rke up --config cluster.yaml
```

2.1.5 - Configure addons and PSPs

Profile Applicability

- Level 1

Description

Configure a restrictive pod security policy (PSP) as the default and create role bindings for system level services to use the less restrictive default PSP.

Rationale

To address the following controls, a restrictive default PSP needs to be applied as the default. Role bindings need to be in place to allow system services to still function.

- 1.7.1 - Do not admit privileged containers (Not Scored)
- 1.7.2 - Do not admit containers wishing to share the host process ID namespace (Not Scored)
- 1.7.3 - Do not admit containers wishing to share the host IPC namespace (Not Scored)
- 1.7.4 - Do not admit containers wishing to share the host network namespace (Not Scored)
- 1.7.5 - Do not admit containers with `allowPrivilegeEscalation` (Not Scored)
- 1.7.6 - Do not admit root containers (Not Scored)
- 1.7.7 - Do not admit containers with dangerous capabilities (Not Scored)

Audit

- Verify that the `cattle-system` namespace exists:

```
kubectl get ns |grep cattle
```

- Verify that the roles exist:

```
kubectl get role default-psp-role -n ingress-nginx
kubectl get role default-psp-role -n cattle-system
kubectl get clusterrole psp:restricted
```

- Verify the bindings are set correctly:

```
kubectl get rolebinding -n ingress-nginx default-psp-rolebinding
kubectl get rolebinding -n cattle-system default-psp-rolebinding
kubectl get clusterrolebinding psp:restricted
```

- Verify the restricted PSP is present.

```
kubectl get psp restricted
```

Remediation

- In the RKE cluster .yaml file ensure the following options are set:

```
addons: |
  apiVersion: rbac.authorization.k8s.io/v1
  kind: Role
  metadata:
    name: default-psp-role
    namespace: ingress-nginx
  rules:
  - apiGroups:
    - extensions
    resourceName:
    - default-psp
    resources:

  kind: Group
  name: system:serviceaccounts
- apiGroup: rbac.authorization.k8s.io
  kind: Group
  name: system:authenticated

```

- Reconfigure the cluster:

```
rke up --config cluster.yml
```

3.1 - Rancher Management Control Plane Installation

3.1.1 - Disable the local cluster option

Profile Applicability

- Level 2

Description

When deploying Rancher, disable the local cluster option on the Rancher Server.

NOTE: This requires Rancher v2.1.2 or above.

Rationale

Having access to the local cluster from the Rancher UI is convenient for troubleshooting and debugging; however, if the local cluster is enabled in the Rancher UI, a user has access to all elements of the system, including the Rancher management server itself. Disabling the local cluster is a defense in depth measure and removes the possible attack vector from the Rancher UI and API.

Audit

- Verify the Rancher deployment has the `--add-local=false` option set.

```
kubectl get deployment rancher -n cattle-system -o yaml |grep 'add-local'
```

- In the Rancher UI go to *Clusters* in the *Global* view and verify that no `local` cluster is present.

Remediation

- While upgrading or installing Rancher 2.3.x, provide the following flag:

```
--set addLocal="false"
```

3.1.2 - Enable Rancher Audit logging

Profile Applicability

- Level 1

Description

Enable Rancher's built-in audit logging capability.

Rationale

Tracking down what actions were performed by users in Rancher can provide insight during post mortems, and if monitored proactively can be used to quickly detect malicious actions.

Audit

- Verify that the audit log parameters were passed into the Rancher deployment.

```
kubectl get deployment rancher -n cattle-system -o yaml | grep auditLog
```

- Verify that the log is going to the appropriate destination, as set by `auditLog.destination`
- sidecar:

1. List pods:

```
kubectl get pods -n cattle-system
```

2. Tail logs:

```
kubectl logs <pod> -n cattle-system -c rancher-audit-log
```

- hostPath

1. On the worker nodes running the Rancher pods, verify that the log files are being written to the destination indicated in `auditLog.hostPath`.

Remediation

Upgrade the Rancher server installation using Helm, and configure the audit log settings. The instructions for doing so can be found in the reference section below.

Reference

- <https://rancher.com/docs/rancher/v2.x/en/installation/ha/helm-rancher/chart-options/#advanced-options>

3.2 - Rancher Management Control Plane Authentication

3.2.1 - Change the local admin password from the default value

Profile Applicability

- Level 1

Description

The local admin password should be changed from the default.

Rationale

The default admin password is common across all Rancher installations and should be changed immediately upon startup.

Audit

Attempt to login into the UI with the following credentials:

- Username: admin
- Password: admin

The login attempt must not succeed.

Remediation

Change the password from `admin` to a password that meets the recommended password standards for your organization.

3.2.2 - Configure an Identity Provider for Authentication

Profile Applicability

- Level 1

Description

When running Rancher in a production environment, configure an identity provider for authentication.

Rationale

Rancher supports several authentication backends that are common in enterprises. It is recommended to tie Rancher into an external authentication system to simplify user and group access in the Rancher cluster. Doing so assures that access control follows the organization's change management process for user accounts.

Audit

- In the Rancher UI, select *Global*
- Select *Security*
- Select *Authentication*
- Ensure the authentication provider for your environment is active and configured correctly

Remediation

Configure the appropriate authentication provider for your Rancher installation according to the documentation found at the link in the reference section below.

Reference

- <https://rancher.com/docs/rancher/v2.x/en/admin-settings/authentication/>

3.3 - Rancher Management Control Plane RBAC

3.3.1 - Ensure that administrator privileges are only granted to those who require them

Profile Applicability

- Level 1

Description

Restrict administrator access to only those responsible for managing and operating the Rancher server.

Rationale

The `admin` privilege level gives the user the highest level of access to the Rancher server and all attached clusters. This privilege should only be granted to a few people who are responsible for the availability and support of Rancher and the clusters that it manages.

Audit

The following script uses the Rancher API to show users with administrator privileges:

```
#!/bin/bash
for i in $(curl -sk -u 'token-<id>:<secret>' https://<RANCHER_URL>/v3/users|jq -r '.data[].links.globalRoleBindings'); do
  curl -sk -u 'token-<id>:<secret>' $i| jq '.data[] | "\(.userId) \(.globalRoleId)'"
done
```

The `admin` role should only be assigned to users that require administrative privileges. Any role that is not `admin` or `user` should be audited in the RBAC section of the UI to ensure that the privileges adhere to policies for global access.

The Rancher server permits customization of the default global permissions. We recommend that auditors also review the policies of any custom global roles.

Remediation

Remove the `admin` role from any user that does not require administrative privileges.

3.4 - Rancher Management Control Plane Configuration

3.4.1 - Ensure only approved node drivers are active

Profile Applicability

- Level 1

Description

Ensure that node drivers that are not needed or approved are not active in the Rancher console.

Rationale

Node drivers are used to provision compute nodes in various cloud providers and local IaaS infrastructure. For convenience, popular cloud providers are enabled by default. If the organization does not intend to use these or does not allow users to provision resources in certain providers, the drivers should be disabled. This will prevent users from using Rancher resources to provision the nodes.

Audit

- In the Rancher UI select *Global*
- Select *Node Drivers*
- Review the list of node drivers that are in an *Active* state.

Remediation

If a disallowed node driver is active, visit the *Node Drivers* page under *Global* and disable it.

Appendix A - Complete RKE cluster.yml Example

```
